

*Analysis of 2013 TCAP Data for SPED Students  
in Boulder Valley, Cherry Creek, Denver, and  
Jeffco*

Prepared by Tom Coyne

Sachuestadvisors.com

October 2013

# *Introduction*

- This report focuses on both single year and multiyear (time series) data to evaluate the performance of Boulder Valley, Cherry Creek, Denver, and Jeffco school districts in terms of their ability to deliver results for the four largest categories of students with IEPs, including those with a Physical, Emotional, Learning, or Speech/Language Disability.
- In terms of demographics, Cherry Creek and Jeffco are the most similar in terms of their percentage of @risk students (i.e., those eligible for Free and Reduced Meals). Boulder has a lower percentage, and Denver a much higher percentage.
- Single year data for 2013 include scale scores and median growth percentiles (MGPs). In essence, single year data focuses on student performance, in terms of average scale score (an absolute measure) and median growth percentile (a relative measure)
- Multiyear data include 5 year Effect Sizes and a metric that sums up five years of MGPs. In contrast to single year data, multiyear data focuses not on students, but rather on the school as a system that seeks to continuously improve its performance, by increasing the average scale score for each grade and by reducing variance (both of which are measured by Effect Size), and by consistently delivering high annual student grade-to-grade growth (as measured by our five year average of MGPs)

## *Note on Effect Size*

- Effect Size equals  $(\text{scale score 2013} - \text{scale score 2009}) / \text{std deviation of scale score in 2013}$ 
  - Put differently, Effect Size measures improvement in terms of the number of standard deviations, to facilitate easy comparison across different groups
  - The Effect Size metric also recognizes that increases in the average and decreases in the standard deviation (variance) of scores both contribute to improved performance.
- Based on Prof John Hattie's metastudies, the grade to grade increase in absolute scale score is equal to about 30% of the starting year standard deviation
  - Therefore, an effect size of .30 means that, over the 2009-2013 period, the improvements undertaken at a school have resulted in an additional year of average scale score growth, or, if you will, movement up the novice to expert spectrum, as measured by TCAP scores. Negative Effect Sizes of (.30) or greater have the opposite meaning
- If you do not have significant positive Effect Sizes, you cannot increase the percentage of students scoring Proficient and Advanced, unless there is a change in the shape of the distribution of scores (i.e., unless it becomes more skewed towards higher scores). As the number of students in a category increases, so too does the probability that the distribution of scores will be "normal" (bell shaped), and its skewness will not change (i.e., increases in percent P&A in the absence of significant positive Effect Sizes are most likely to occur when the number of students in a category is small).

# *The Relationship of Effect Size and Median Growth Percentile*

- Effect Size is based on the absolute change in scale scores over a five year time horizon for students at a single level (E/M/H).
- In contrast, Median Growth Percentile is a relative measure based on the median absolute scale score increase from grade-to-grade.
- It is CRITICAL to note that MGPs can be above the 50th percentile each year without generating a significant positive Effect Size. For example, assume that in each of five years, incoming students have a previous grade TCAP score of XXX. Further assume that in each of these five years, a school raises the median student's scale score by 50 points, to YYY, which results in a Median Growth Percentile of 60 each year.
- Because there was no increase in YYY (the ending median scale score) over the five year period, the Effect Size would be zero. This highlights that while the school in the example is doing a commendable job with different classes of students each year, over the full five year period it has not, as a system, improved its ability to move students up the novice to expert spectrum, as there is no growth in the average TCAP score (note that in this example I assume the median score equals the average score, as is the case in a normal distribution)

# *Key Findings*

- Of the four districts, Boulder Valley has the largest number of categories (Disability/Subject/School Level) with negative Effect Sizes greater than (.30)
- There is a significant reduction in the number of students with speech/language disabilities between Elementary and Middle School, suggesting that all four districts are successfully addressing these issues while students are young
- Given the differences in the percent of F&R eligible students in the four districts, the most valid comparison of Average Scale Scores, and percent proficient and advanced, is between Cherry Creek and Jeffco, which have comparable, if not exactly equal, percentages of F&R students
- In contrast, Annual and 5 year average Median Growth Percentiles, and 5 year Effect Sizes are all comparable across districts
- Across all four districts, all four disabilities, and all three subject areas (math, reading, and writing), Effect Sizes are mostly below the +.30 threshold that signifies a significant improvement in the system over time, in terms of its ability to move students up the novice to expert spectrum that is measured by the CSAP/TCAP scoring scale
- Similarly, the five year average of Median Growth Percentile is generally below 50 across all four districts, disabilities, and subjects

# *Conclusions*

- In spite of the substantial amount of money spent annually on various special education programs, none of the four districts studied has been able to deliver significant improvements in achievement growth as measured by Effect Sizes (and/or average MGPs), despite the initiatives I assume they have undertaken for this purpose over the past five years
- This is in contrast to other areas (e.g., Free & Reduced, ELL, GT, etc.) where this same type of analysis finds that these four districts have achieved higher annual Median Growth Scores, and generated significant positive Effect Sizes
- This inevitably raises questions about why SPED is different, and/or the continuous improvement, experimentation, and innovation processes employed by the SPED teams in these four districts
- The number of analytical categories in Boulder Valley that show negative Effect Sizes of (.30) or more is of particular concern
- The one bright spot in this analysis is the performance of all four districts with respect to the achievement of students with speech/language disabilities, and, apparently, the reduction of those disabilities in a substantial number of students
